2018-

M.Sc. Internal

भाग-2

चौधरी चरण सिंह विश्वविद्यालय, मेरठ

Ch. Charan Singh University, Meerut

निम्नलिखित विवरण परीक्षार्थी द्वारा स्वयं भरा जाए (To be filled by the Examinee)

परीक्षा का नाम
(Name of Exam)वर्ष 20
(Year 20.....)भाग/सेमेस्टर
(Part / Semester)विषय
(Subject)प्रश्न-पत्र/पाठ्यक्रम
(Paper /Course)पेपर कोड नं.
(Paper Code No.)परीक्षा का दिन
(Day of Examination)दिनांक
(Date)

प्राप्तांक एवं पूर्णांक परीक्षार्थी द्वारा भरे जायें

पूर्णांक
(Max. Marks)

| प्रश्नों की क्रम संख्या | a/I | b/II | c/III | d/IV | e/V | f/VI | g/VII | h/VIII | i/IX | j/X | योग |

पेपर कोड

परीक्षार्थी का पूरा नाम

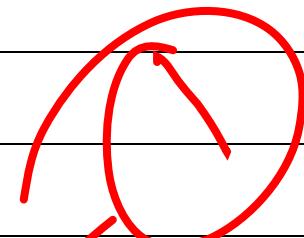

कक्ष निरीक्षक का नाम

Section - A

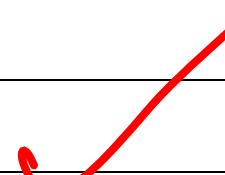

Ans 1 →

Uracine

- It is present in the DNA & RNA both.

- In this Adenine & Guanine is present.

- It is triple bonded.

Hydouridine

- In the DNA Thymine is present but in RNA at the place of Thymine, Uracil is present.

- In this Cytosine, Thymine & Uracil is present.

- It is double bonded.

- $A = T$
 ~~$G = C$~~

Ans 3 → Vitamin

- Vitamins are very essential for our body.
- Vitamins are taken in limited quantity. Without vitamins there is a deficiency present in the body.

Enzyme

- Enzymes speed up the rate of biochemical reaction.
- Without enzymes our body works slowly.

- Vitamins are of many types — Vitamin A, B, C, D, E, K etc.

- Enzymes have the active site which are attached by the substrate.

Ans 4 → Co-factor

- Co-factor is a non-protein molecule.

- Co-factor has the prosthetic group which are tightly bound.

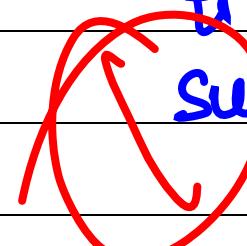

Enzyme

- Enzyme speed up the rate of biochemical reaction.

- Enzyme have the active site which are attached by the substrate.

- Co-factor has - active site & binding site.

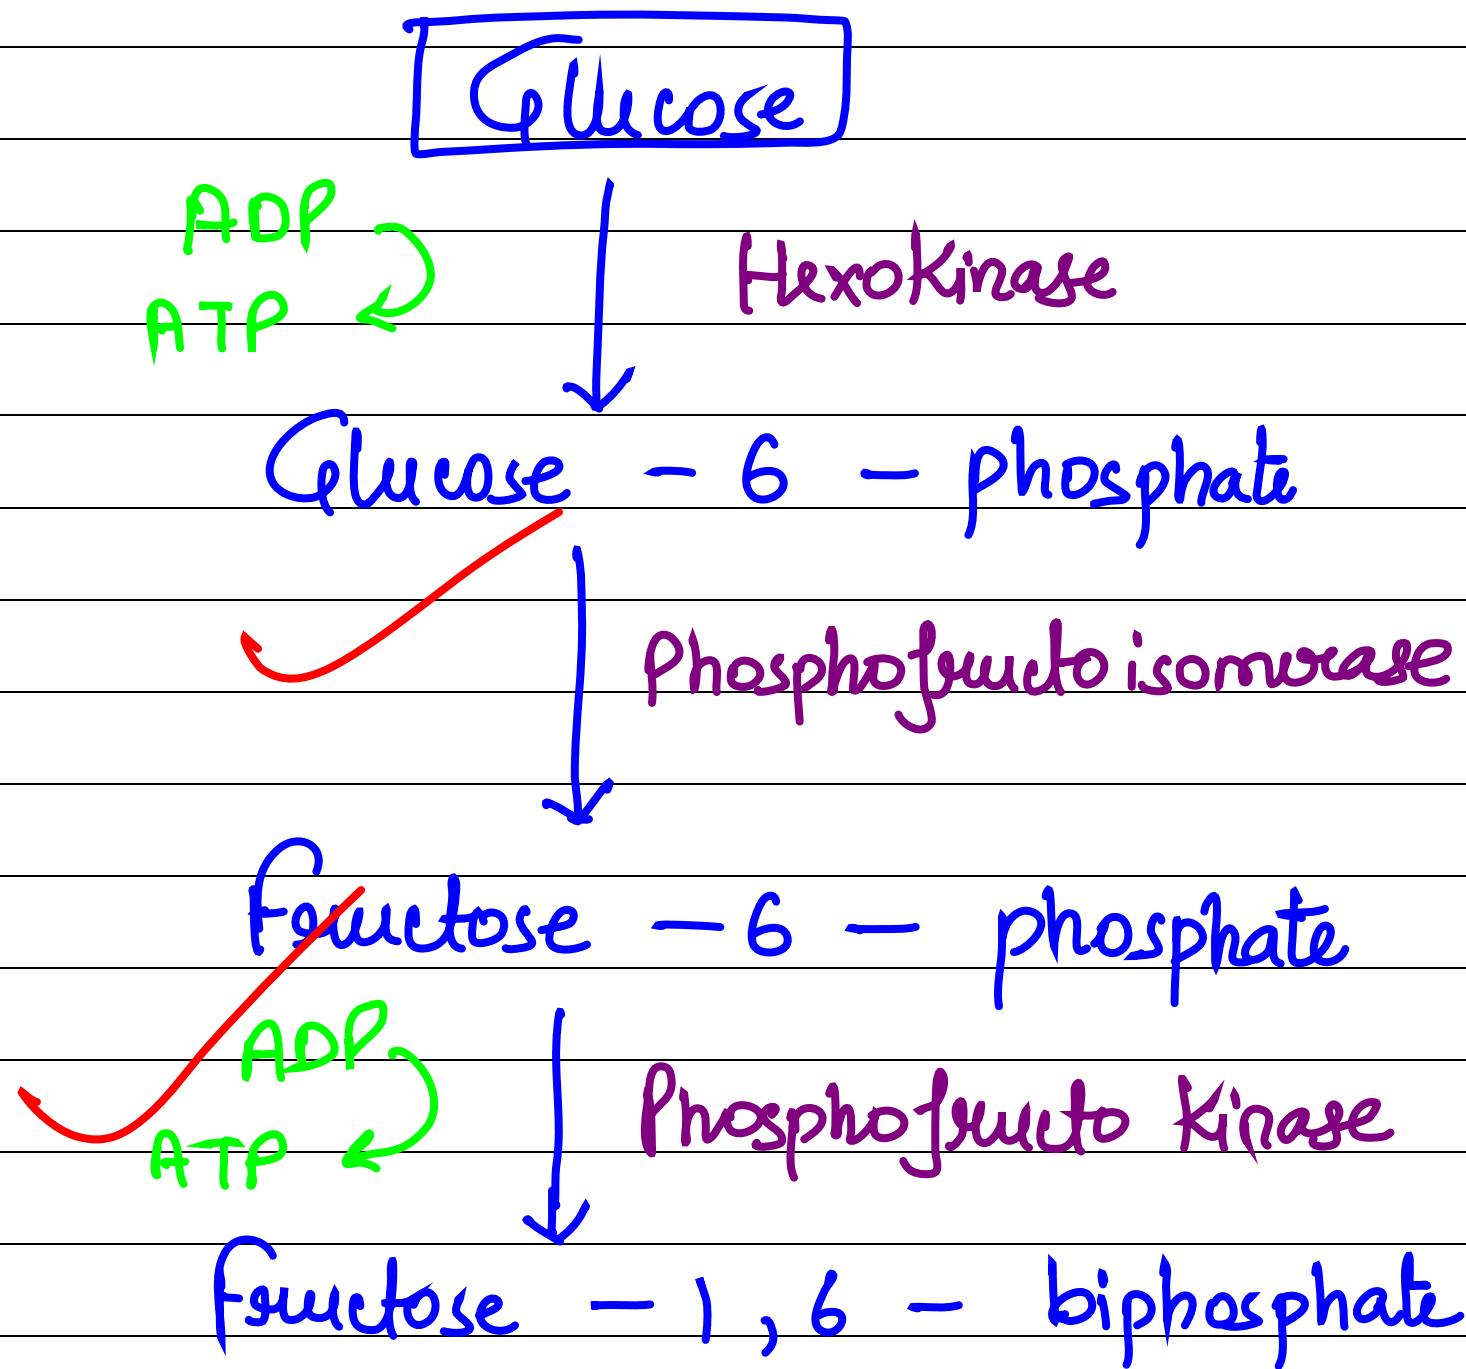

- Enzyme forms the substrate & product.

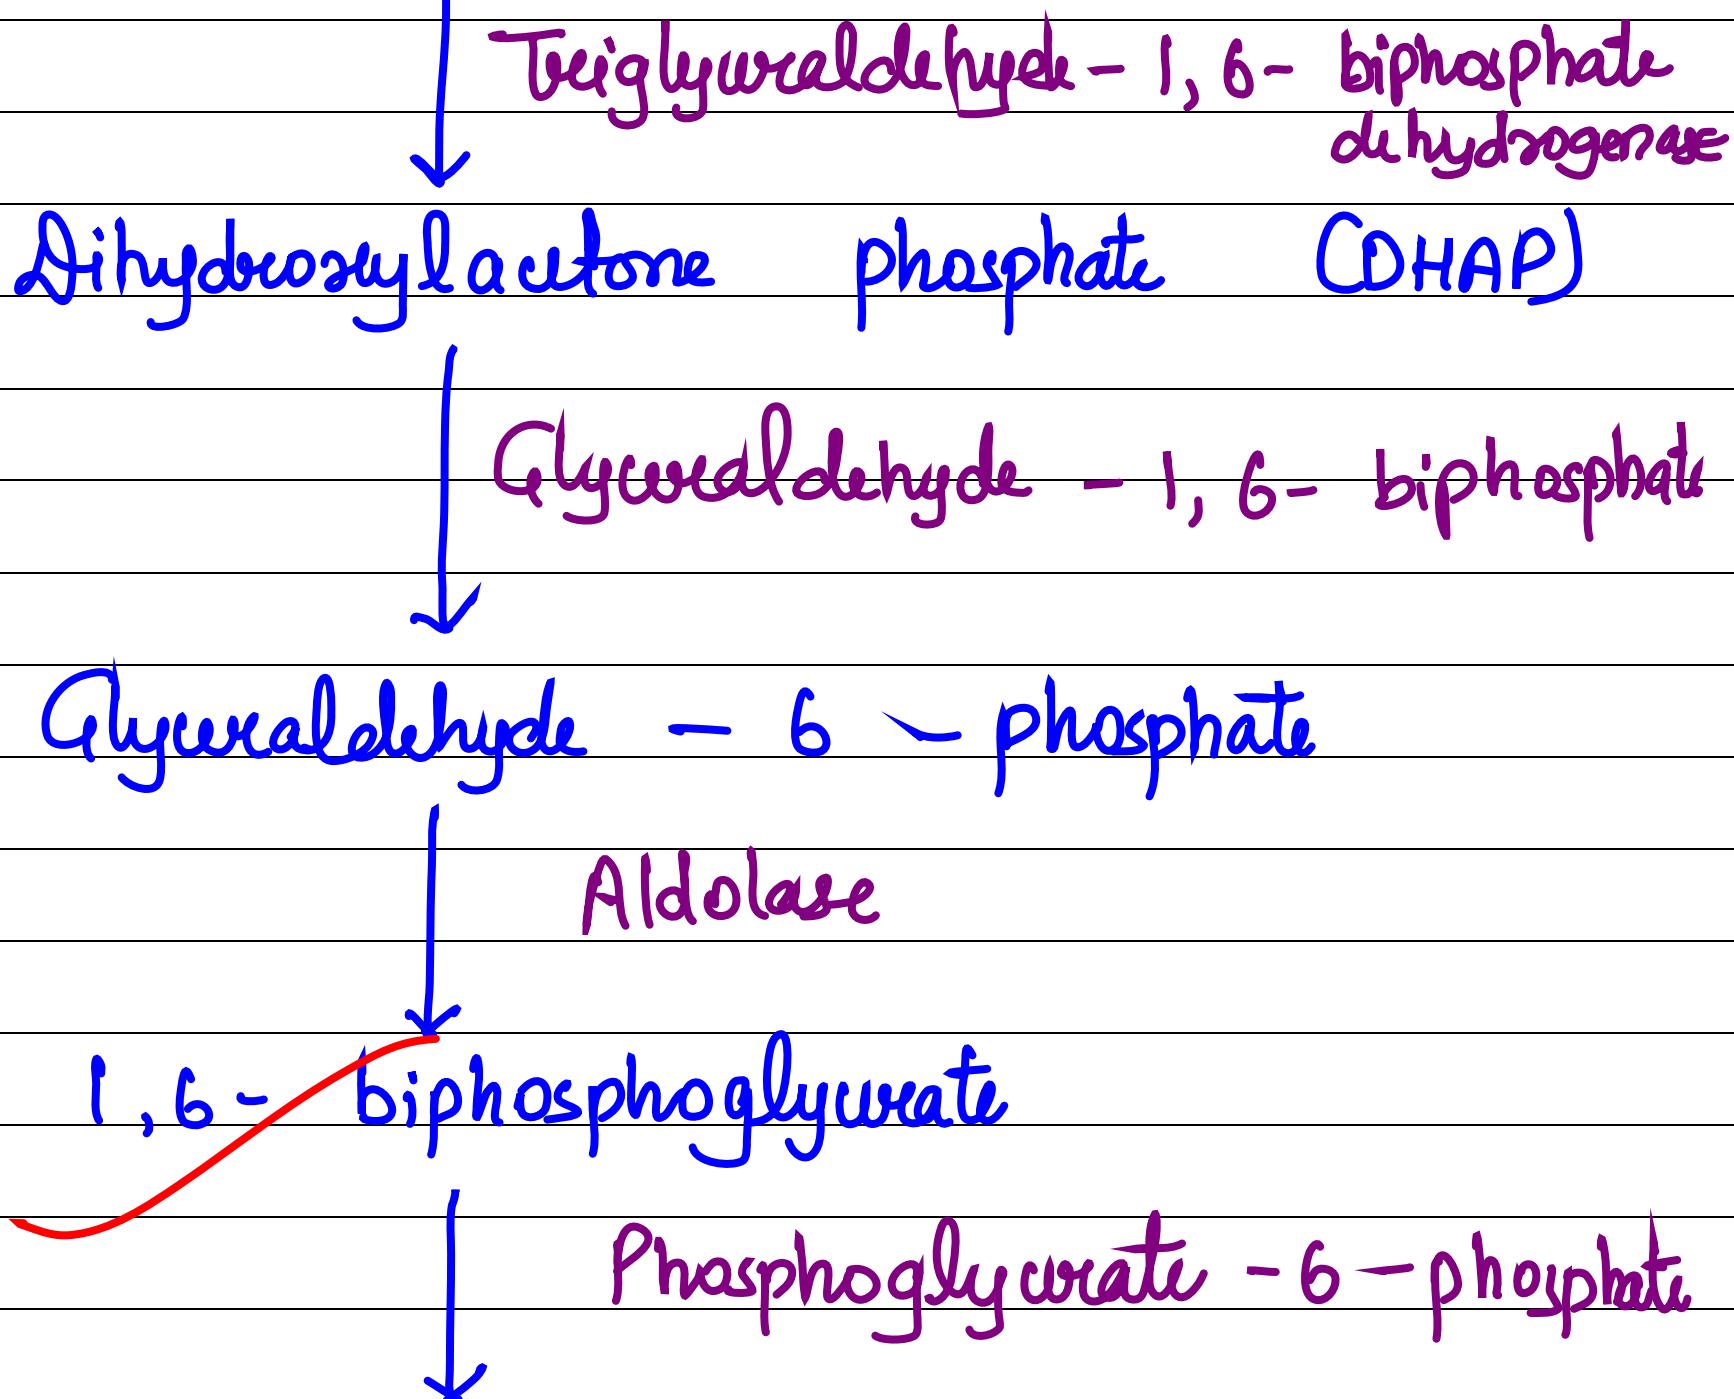

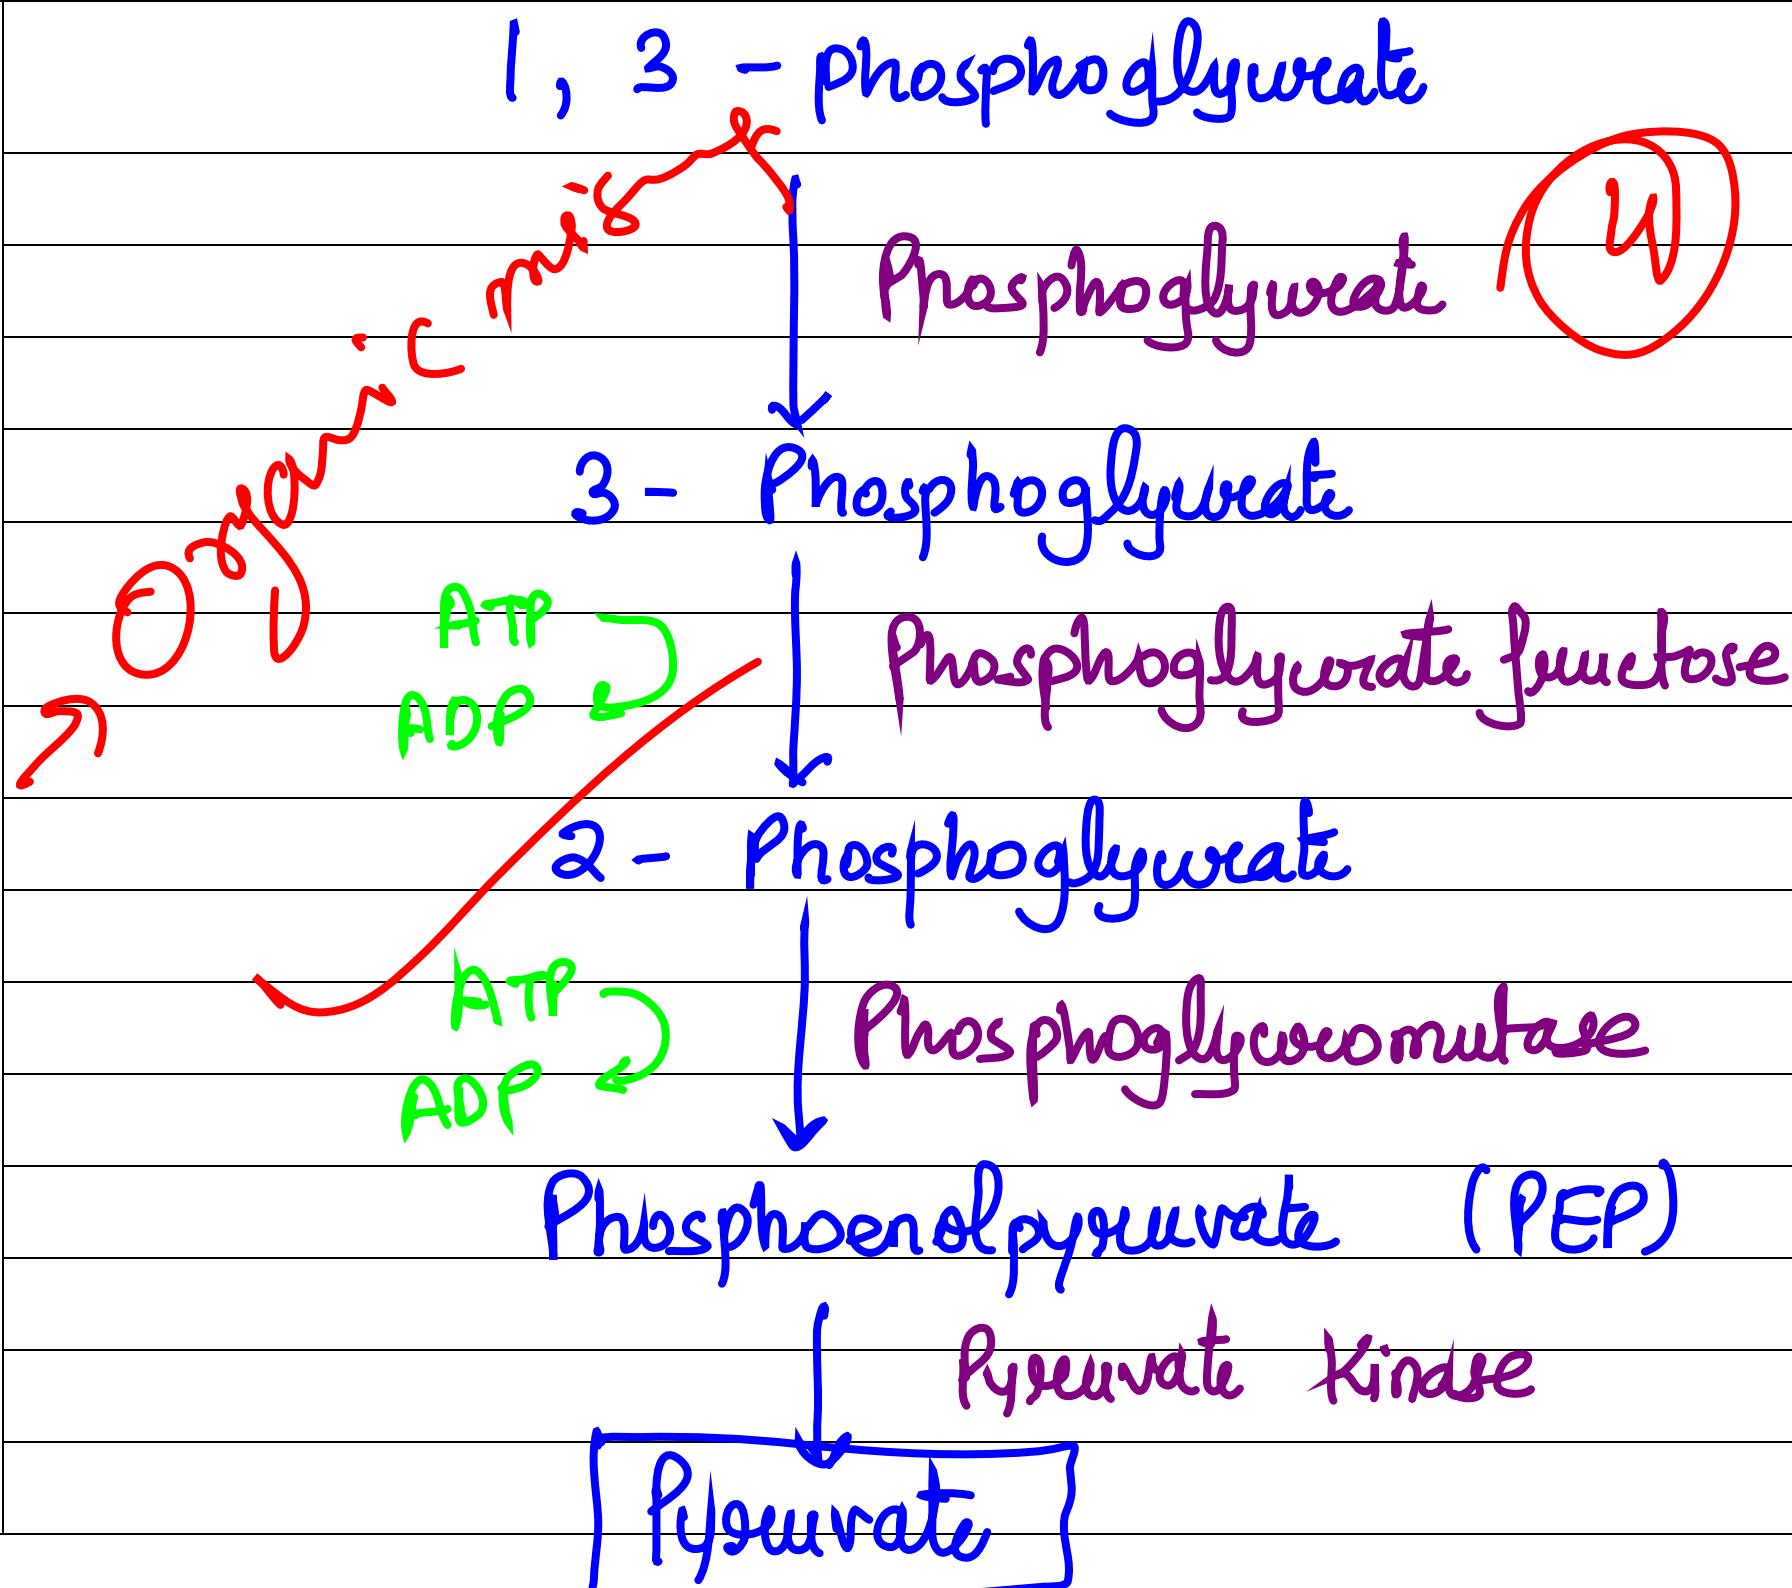

Section - C

Ans 10 →

Glycolysis is a process in which glucose is converted into Pyruvate.

Ans II -

Enzyme Regulation

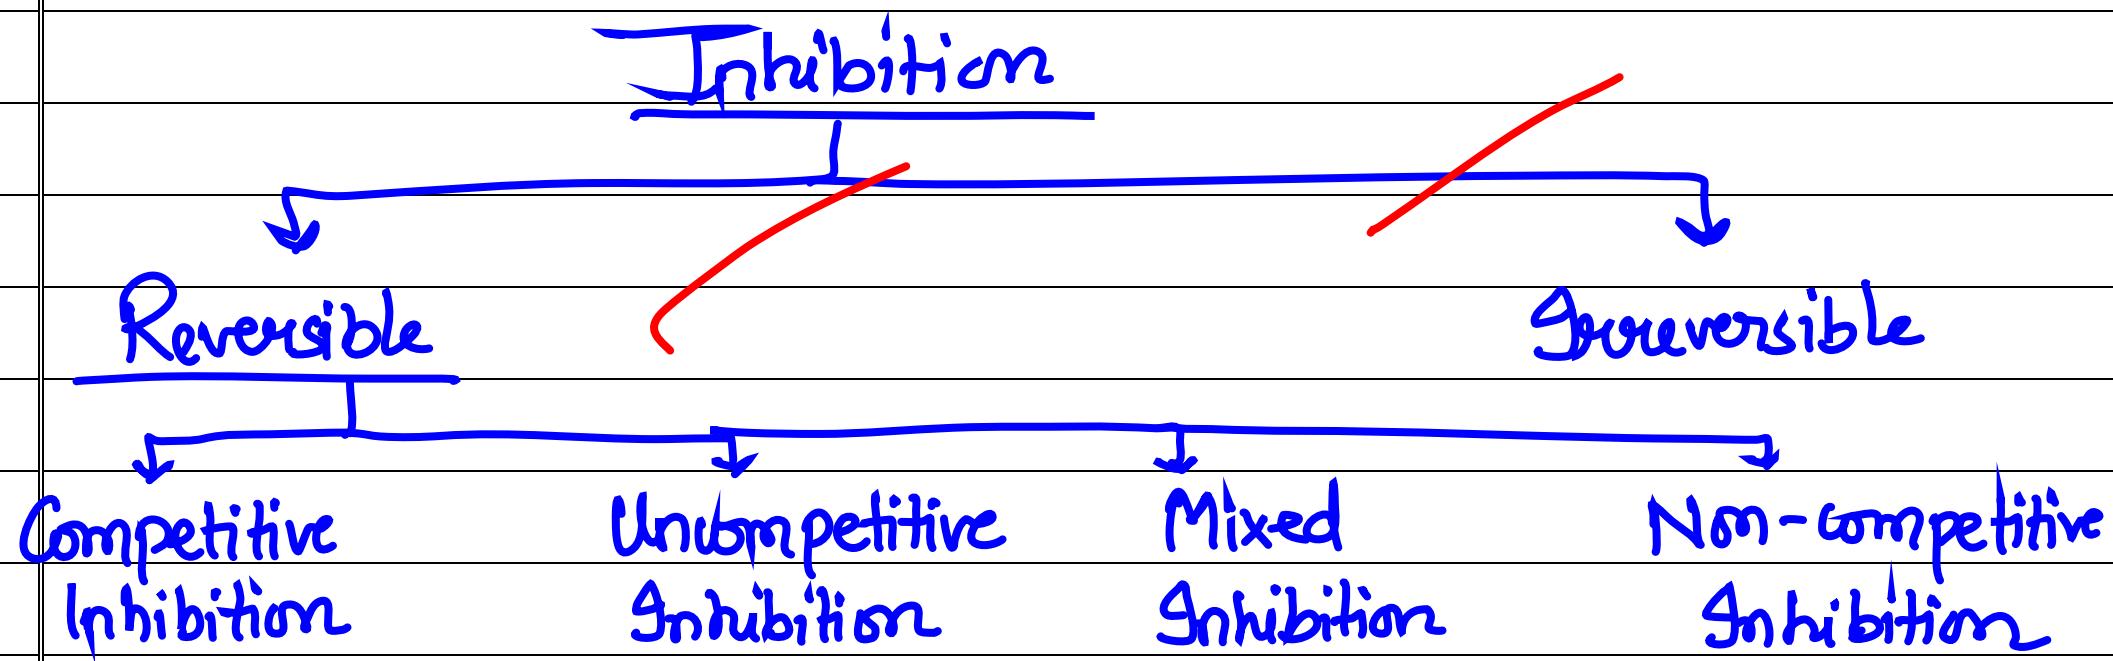

- * Enzyme regulation is a process in which the rate of reaction is increases when activation site is present & rate of reaction is decreases when inhibition site is present.
- * Enzyme regulation activate & inhibit the growth of the reaction.

Enzyme → Speed up the rate of chemical reaction.

Regulation → Activation & Inhibition

Inhibition -

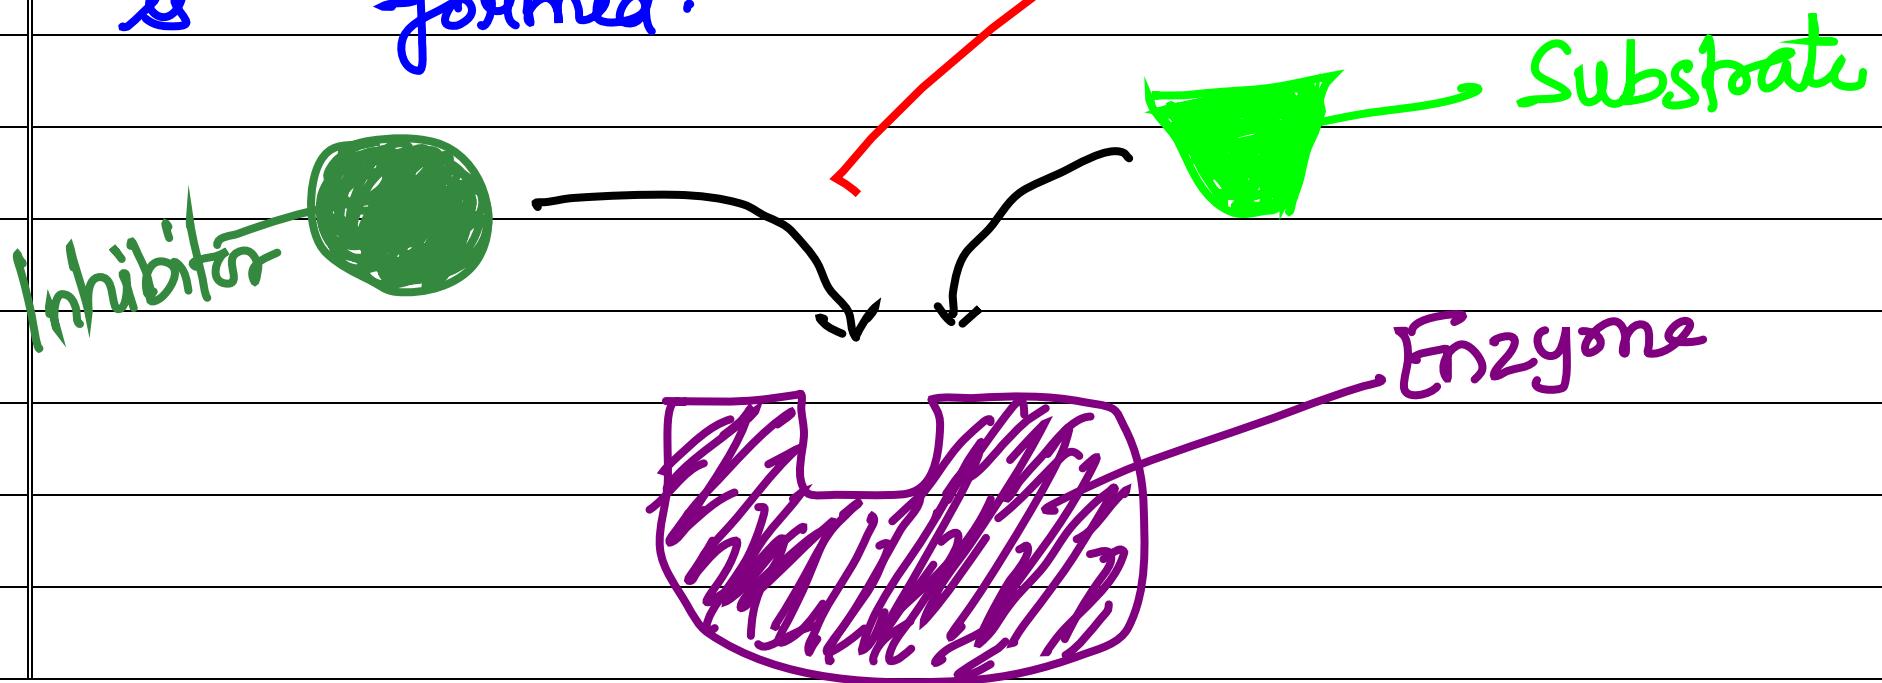

The state of reaction inhibits or stop is termed as inhibition -

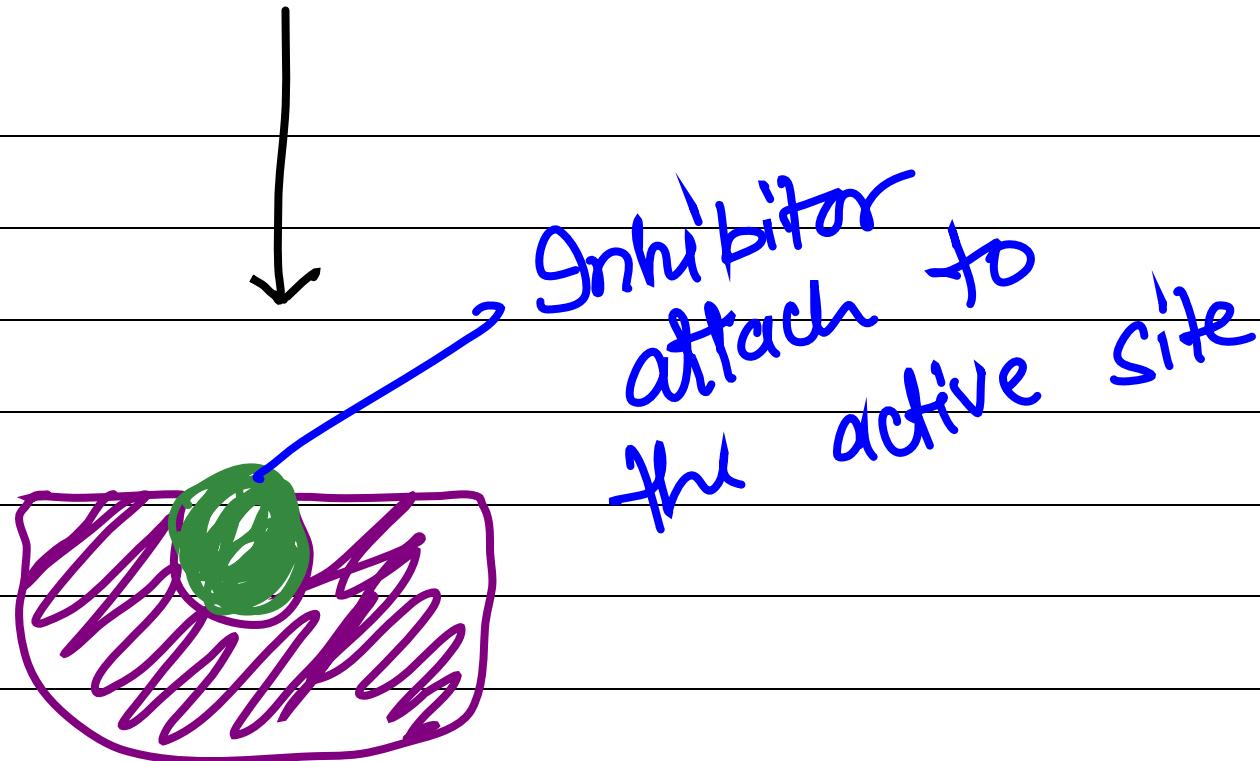

Competitive Inhibition :-

In competitive inhibition there is a competition b/w inhibitor & substrate to attach to the active site.

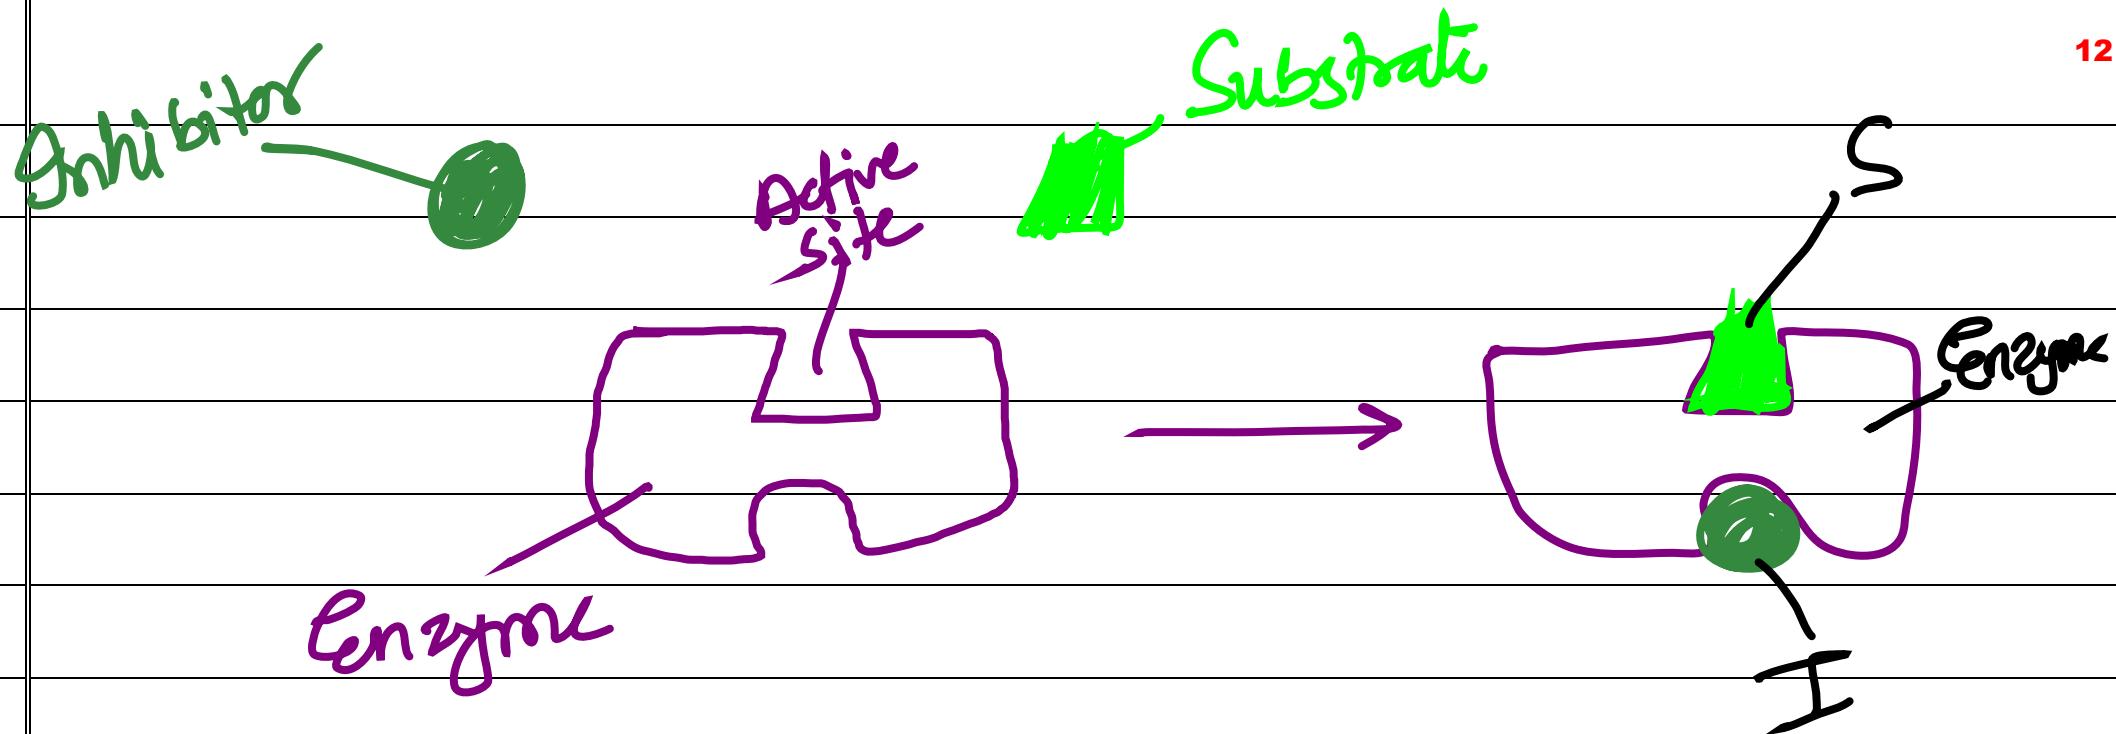

The formation of new complex is E-S complex & the E-I complex is formed.

Uncompetitive Inhibition -

In this Inhibition there is no competition b/w Inhibitor & Substrate because in this there is an another site i.e., allosteric site at which the Inhibitor is attach.

Mixed Inhibition -

In this inhibition there is a mixture of E·I or E·S·I complex.

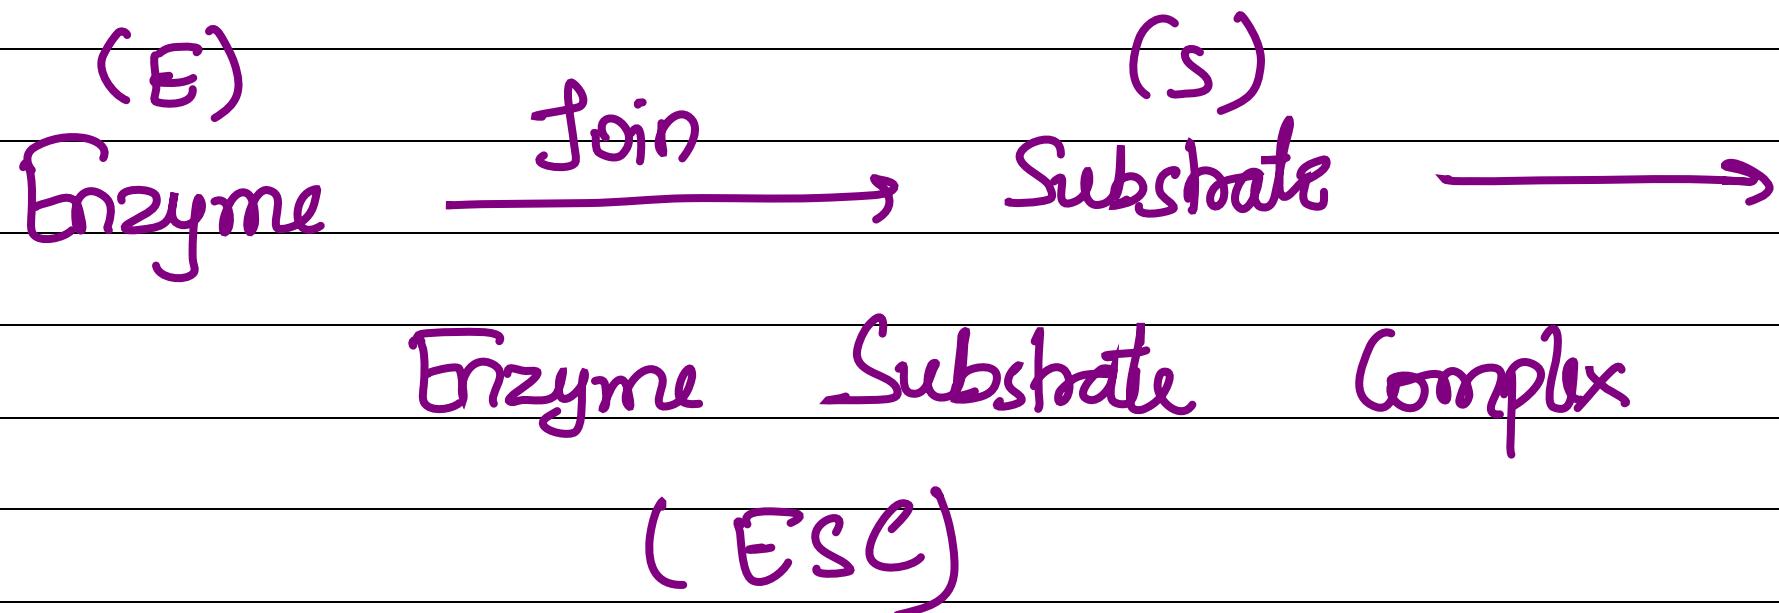

- It is forms in the catalytic reaction

Non-Competitive Inhibition -

- In this inhibition there is no competition.
- It is a very specific type of inhibition.
- In this catalytic reaction is present.

Activation -

In this the inactive site of the reaction is become active.

- In activation energy there is no competition.
- In this the inactive form become active.

Section -B

Ans 7) pH :-
 $\text{pH} = -\log [\text{H}^+]$

- It is the negative logarithm of hydrogen ion concentration-
 - pH maintains the body level.
 - pH is of three types -
- Acidic — 0 to 7
 → Neutral — 7

→ Basic — 7 to 14

- When the H^+ ion concentration increase the pH is acidic.
- When the OH^- ion concentration is increase then the pH is basic.
- Normal pH — 7.35 to 7.45
- pH is measured by —
 - pH Indicator
 - pH meter
 - pH stripes

- The pH of water is neutral i.e., 7.

Acidic pH :-

When the H^+ ion concentration is increases then the pH is acidic. (electron donor).

e.g. Carbonic acid donate H^+ .

Basic pH :-

When the H^+ ion concentration is less than this is basic pH. (electron acceptor)

Role of pH in digestion -

- Digestive system is the very essential system of our body.
- When we digest the food much the pH level is very sufficient.

Mouth -

- pH is 7
- When the food enters in the mouth the pH level is 7 i.e., neutral.

- When the food mixed with the saliva & forms the bolus then the pH is become acidic i.e., 4 or 5.

Oesophagus :-

- In digestion the next step is oesophagus-
- Food is mixed with mucus & lubricate through oesophagus.

Stomach :-

- When the food goes in the stomach then the pH is 2.

- The pH become more acidic to digest the food easily.
- It secrete the pepsin, pepsinogen & most of the enzymes to digest the food.
- In stomach HCl is present which break down the food & kill the germs which is present in boli.
- In stomach the pH level is 2 i.e., acidic to digest the food.

Ans 8-i

- Blood is the fluid connective tissue.
- It is composed of plasma and proteins.
- Buffer -

Buffer is defined as the substance which maintain the pH level & provide the equilibrium to the acid & base.

Acidic buffer :-

The acidic buffer is

worked with the weak acid & a salt of conjugate base.

Basic buffer :-

In basic buffer there is a weak base & a salt of conjugate acid.

- In blood buffer maintain the pH level.
- The blood exchange the O_2 & CO_2 .

- The oxygenated blood purifies the deoxygenated blood in lungs.
- In this blood capillaries are present.
- pH maintain the blood & the haemoglobin which is present in the blood.
- Due to the haemoglobin the blood becomes red in colour.

Section-A

Ans 2

CDNA & CDNA^g-

CDNA → It is a type of DNA.

cDNA

- ~~EDNA~~ is the complementary DNA.
- cDNA is prepared in the lab.
- It is present in the DNA.
- It is the type of the DNA.
- It is right-handed DNA.
- In this complementary strands are present.

Ans 5: Glucogenesis

- Glucogenesis is the formation of glucose.
- It is present in the carbohydrate.
- In this glucose are present which is very essential for our body.

Gluconeogenesis

- Gluconeogenesis is the formation of glucose + galactose.
- It is also present in the carbohydrate.
- In this glucose is present but also galactose present which is also essential.
